For this data model, any column name that occurs in more than one table (copy n) will be represented as a join column physical name (FKn). Only those columns that participate in primary keys, major alternate unique keys, or in alternate unique keys n participate in this table in this diagram, but all copies represent the same column. This data may be imported with the soil tabular data. The macro “Import Feature Descriptions” must be used to import spot feature classes.

**Spot feature descriptions may be imported into a SSURGO template database, but they are not automatically imported and only one record in table A is related to one or more records in table B.**
