<th>Column Physical Name</th>
<th>Column Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aashtocl</td>
<td>AASHTO</td>
<td>A rating based on a system that classifies soils according to those properties that affect roadway construction and maintenance. Soils are classified into seven basic groups plus eight subgroups, for a total of fifteen for mineral soils. Another class for organic soils is used. The groups are based on determinations of particle-size distribution, liquid limit, and plasticity index. The group classification, including group index, is useful in determining the relative quality of the soil material for use in earthwork structures, particularly embankments, subgrades, subbases, and bases. (American Association of State Highway and Transportation Officials)</td>
</tr>
<tr>
<td>rvindicator</td>
<td>RV?</td>
<td>A yes/no field that indicates if a value or row (set of values) is representative for the component.</td>

- **Mineral particles less than 0.002mm in equivalent diameter as a weight percentage of the less than 2.0mm fraction.**
- **Carbonate particles less than 0.002mm in equivalent diameter as a weight percentage of the less than 2.0mm fraction.**
- **The amount by weight of decomposed plant and animal residue expressed as a weight percentage of the less than 2 mm soil material.**
- **The oven dried weight of the less than 2 mm soil material per unit volume of soil at a water tension of 1/10 bar.**
- **The oven dry weight of the less than 2 mm soil material per unit volume of soil at a water tension of 1/3 bar.**
- **The oven dry weight of the less than 2 mm soil material per unit volume of soil at a water tension of 15 bar.**

**Part Density (Dp):** Mass per unit of volume (not including pore space) of the solid soil particle either mineral or organic. Also known as specific gravity.
Table Column Descriptions

Table Physical Name: chorizon
Table Label: Horizon

Column Group Label: Ksat

Column Physical Name: ksat_l
Column Label: Low
Column Physical Name: ksat_r
Column Label: RV
Column Physical Name: ksat_h
Column Label: High

The amount of water that would move vertically through a unit area of saturated soil in unit time under unit hydraulic gradient.

Column Group Label: AWC

Column Physical Name: awc_l
Column Label: Low
Column Physical Name: awc_r
Column Label: RV
Column Physical Name: awc_h
Column Label: High

The amount of water that an increment of soil depth, inclusive of fragments, can store that is available to plants. AWC is expressed as a volume fraction, and is commonly estimated as the difference between the water contents at 1/10 or 1/3 bar (field capacity) and 15 bars (permanent wilting point) tension and adjusted for salinity, and fragments.

Column Group Label: 0.1 bar H2O

Column Physical Name: wtenthbar_l
Column Label: Low
Column Physical Name: wtenthbar_r
Column Label: RV
Column Physical Name: wtenthbar_h
Column Label: High

The volumetric content of soil water retained at a tension of 1/10 bar (10 kPa), expressed as a percentage of the whole soil.

Column Group Label: 0.33 bar H2O

Column Physical Name: wthirdbar_l
Column Label: Low
Column Physical Name: wthirdbar_r
Column Label: RV
Column Physical Name: wthirdbar_h
Column Label: High

The volumetric content of soil water retained at a tension of 1/3 bar (33 kPa), expressed as a percentage of the whole soil.

Column Group Label: 15 bar H2O

Column Physical Name: wfifteenbar_l
Column Label: Low
Column Physical Name: wfifteenbar_r
Column Label: RV
Column Physical Name: wfifteenbar_h
Column Label: High

The volumetric content of soil water retained at a tension of 15 bars (1500 kPa), expressed as a percentage of the whole soil.

Column Group Label: Satiated H2O

Column Physical Name: wsatiated_l
Column Label: Low
Column Physical Name: wsatiated_r
Column Label: RV
Column Physical Name: wsatiated_h
Column Label: High

The estimated volumetric soil water content at or near zero bar tension, expressed as a percentage of the whole soil.

Column Group Label: LEP

Column Physical Name: lep_l
Column Label: Low
Column Physical Name: lep_r
Column Label: RV
Column Physical Name: lep_h
Column Label: High

The linear expression of the volume difference of natural soil fabric at 1/3 or 1/10 bar water content and oven dryness. The volume change is reported as percent change for the whole soil.

- **LL**
  - Column Physical Name: ll_l  
  - Column Label: Low  
  - The water content of the soil at the change between the liquid and plastic states.
  - Column Physical Name: ll_r  
  - Column Label: RV
  - Column Physical Name: ll_h  
  - Column Label: High

- **PI**
  - Column Physical Name: pi_l  
  - Column Label: Low
  - The numerical difference between the liquid limit and plastic limit.
  - Column Physical Name: pi_r  
  - Column Label: RV
  - Column Physical Name: pi_h  
  - Column Label: High

- **AASHTO Group Index**
  - Column Physical Name: aashind_l  
  - Column Label: Low
  - The empirical group index formula devised for approximately within-group evaluation of the "clayey granular materials" and the "silty-clay materials".
  - Column Physical Name: aashind_r  
  - Column Label: RV
  - Column Physical Name: aashind_h  
  - Column Label: High

- **CaCO3**
  - Column Physical Name: caco3_l  
  - Column Label: Low
  - The quantity of Carbonate (CO3) in the soil expressed as CaCO3 and as a weight percentage of the less than 2 mm size fraction.
  - Column Physical Name: caco3_r  
  - Column Label: RV
  - Column Physical Name: caco3_h  
  - Column Label: High

- **Gypsum**
  - Column Physical Name: gypsum_l  
  - Column Label: Low
  - The percent by weight of hydrated calcium sulfate in the less than 20 mm fraction of soil.
  - Column Physical Name: gypsum_r  
  - Column Label: RV
  - Column Physical Name: gypsum_h  
  - Column Label: High

- **SAR**
  - Column Physical Name: sar_l  
  - Column Label: Low
  - A measure of the amount of Sodium (Na) relative to Calcium (Ca) and Magnesium (Mg) in the water extract from saturated soil paste.
  - Column Physical Name: sar_r  
  - Column Label: RV
  - Column Physical Name: sar_h  
  - Column Label: High

</tbody>
</table>

The amount of ammonium oxalate extractable iron in the less than 2mm fraction. It is considered a measure of noncrystalline iron in the soil.

| **Column Physical Name:** extracid_l | Column Group Label: Ext Acidity |
| **Column Physical Name:** extracid_r | Column Label: Low |
| **Column Physical Name:** extracid_h | Column Label: RV |

A measure of soil exchangeable hydrogen ions that may become active by cation exchange.

| **Column Physical Name:** extral_l | Column Group Label: Extract Al |
| **Column Physical Name:** extral_r | Column Label: Low |
| **Column Physical Name:** extral_h | Column Label: RV |

The amount of aluminum extracted in 1 normal potassium chloride. The following laboratory method is applied: 55 ml of 1 normal potassium chloride is extracted through 2.5 g of soil sample. The extract is analyzed by use of an atomic adsorption spectrometer or similar instrument (SSIR #1, method 6G9a and NSSH).

| **Column Physical Name:** aloxalate_l | Column Group Label: Oxalate Al |
| **Column Physical Name:** aloxalate_r | Column Label: Low |
| **Column Physical Name:** aloxalate_h | Column Label: RV |

The amount of ammonium oxalate extractable aluminum in the less than 2mm fraction. This is an estimate of the total pedogenic aluminum, much of which may be in noncrystalline material, or complexed by organic matter.

| **Column Physical Name:** pbray1_l | Column Group Label: Bray 1 Phos |
| **Column Physical Name:** pbray1_r | Column Label: Low |
| **Column Physical Name:** pbray1_h | Column Label: RV |

The amount of phosphorous in the less than 2mm fraction, that is extractable using the Bray1 method. It represents the plant available phosphorous content.

| **Column Physical Name:** poxalate_l | Column Group Label: Oxalate Phos |
| **Column Physical Name:** poxalate_r | Column Label: Low |
| **Column Physical Name:** poxalate_h | Column Label: RV |

The amount of phosphorous in the less than 2mm fraction, that is extractable by aluminum oxalate method. It represents the phosphorous level intermediate between total P and water soluble P.

| **Column Physical Name:** ph2osoluble_l | Column Group Label: Water Soluble Phos |
| **Column Physical Name:** ph2osoluble_r | Column Label: Low |
| **Column Physical Name:** ph2osoluble_h | Column Label: RV |

The amount of water soluble phosphorous in the less than 2mm fraction, that is extractable by distilled water. It represents the mobile phosphorous content.

### Table Column Descriptions

**Table Physical Name:** component  
**Table Label:** Component

**Column Group Label:** Comp %

- **Column Physical Name:** compct_l  
  **Column Label:** Low

- **Column Physical Name:** compct_r  
  **Column Label:** RV

- **Column Physical Name:** compct_h  
  **Column Label:** High

*The percentage of the component of the mapunit.*

- **Column Physical Name:** compname  
  **Column Label:** Component Name

*Name assigned to a component based on its range of properties.*

- **Column Physical Name:** compkind  
  **Column Label:** Kind

*Identifies the kind of component of the mapunit. Examples are series and miscellaneous areas.*

- **Column Physical Name:** majcompflag  
  **Column Label:** Major Component

*Indicates whether or not a component is a major component in the mapunit.*

- **Column Physical Name:** otherph  
  **Column Label:** SIR phase

*Phase criterion other than slope, texture, and flooding used to identify soil components.*

- **Column Physical Name:** localphase  
  **Column Label:** Local Phase

*Phase criterion to be used at a local level, in conjunction with "component name" to help identify a soil component.*

**Column Group Label:** Slope Gradient

- **Column Physical Name:** slope_l  
  **Column Label:** Low

- **Column Physical Name:** slope_r  
  **Column Label:** RV

- **Column Physical Name:** slope_h  
  **Column Label:** High

*The difference in elevation between two points, expressed as a percentage of the distance between those points. (SSM)*

**Column Group Label:** Slope Length USLE

- **Column Physical Name:** slopelenusle_l  
  **Column Label:** Low

- **Column Physical Name:** slopelenusle_r  
  **Column Label:** RV

- **Column Physical Name:** slopelenusle_h  
  **Column Label:** High

*The distance from the point of origin of overland flow to the point where either the slope gradient decreases enough that deposition begins, or the runoff water enters a well-defined channel that may be part of a drainage network or a constructed channel. (Predicting Rainfall Erosion Losses a Guide to Conservation Planning, Agr. Handbook #537, USDA, 1978).*

- **Column Physical Name:** runoff  
  **Column Label:** Runoff Class

*Runoff potential class for the soil.*

- **Column Physical Name:** tfact  
  **Column Label:** T

*Soil loss tolerance factor. The maximum amount of erosion at which the quality of a soil as a medium for plant growth can be maintained.*

- **Column Physical Name:** wei  
  **Column Label:** WEI

*A value in tons/acre/year that is a factor in calculating soil loss by wind. The values are acquired from WEG.*
Table Column Descriptions

**Corrosion Concrete**

Susceptibility of concrete to corrosion when in contact with the soil.

**Corrosion Steel**

Susceptibility of uncoated steel to corrosion when in contact with the soil.

**Taxonomic Class**

A concatenation of the Soil Taxonomy subgroup and family for a soil (long name).

**Order**

The highest level in Soil Taxonomy.

**Suborder**

The second level of Soil Taxonomy. The suborder is below the order and above the great group.

**Great Group**

The third level of Soil Taxonomy. The category is below the suborder and above the subgroup.

**Subgroup**

The fourth level of Soil Taxonomy. The subgroup is below great group and above family.

**Particle Size**

Particle-size classes are used as family differentiae. Particle-size refers to grain-size distribution of the whole soil and is not the same as texture. (Soil Taxonomy).

**Particle Size Mod**

Taxonomic family criteria that is used to indicate the presence of more than two strongly contrasting classes in the particle size control section. (Soil Taxonomy)

**CEC Activity Cl**

Cation exchange activity classes are used as family criteria differentiae. It is the relative cation exchange (CEC) activity level of the soil based on the CEC to clay ratio. (Soil Taxonomy)

**Reaction**

Indicates the presence or absence of carbonates and the reaction. They are treated together because of their intimate relationship, and are used to indicate family differentiae. (Soil Taxonomy)

**Temp Class**

The taxonomic family temperature class used to construct the official classification name. It may be null when the taxonomic family temperature class is embedded in the classification name. The actual taxonomic temperature regime is recorded in another place.

**Moist Subclass**

Soil moisture subclasses are taxonomic subgroup criteria, whether included or not in the name of the subgroup. The definition of each subclass is dependent upon the specific taxonomic great group to which it is attached.

<tr>
<td>flhe</td>
<td>FL HE</td>
<td>A data element with a yes/no entry, assigned by soil component, used in Florida. It is used to identify highly erodible land.</td>
</tr>
<tr>
<td>flphe</td>
<td>FL PHE</td>
<td>A data element with a yes/no entry, assigned by soil component, used in Florida. The basis for identifying highly erodible land is the erodibility index of a soil survey map unit. The erodibility index of a soil is determined by dividing the potential erodibility for each soil survey map unit by the soil loss tolerance (T) value established for the soil. The potential erodibility for a map unit differs according to the erosion type (water or wind erosion). The T value represents the maximum annual rate of soil erosion that could take place without causing a decline in long-term productivity. A soil map unit with an erodibility index of 8 or more is a highly erodible soil map unit. For water erosion, a soil survey map unit is potentially highly erodible if: (1) the RKLS/T value using the minimum LS factor is less than 8 and (2) the RKLS/T value using the maximum LS factor is equal to or greater than 8. (Predicting Rainfall Erosion Losses; A Guide to Conservation Planning, Field Office Technical Guide, Nat. FSA Handbook Sec. 511.23, and Florida Erosion Control Handbook)</td>

Table Column Descriptions

Table Physical Name: component
Table Label: Component

Column Physical Name: fltriumph2use
Column Label: FL Triumph

Soil related use restrictions for Triumph 4E Insecticide are applicable in certain conditions in Florida. Please note the label for the conditions. The soil related conditions are as follows:
1. A permeability of six inches/hour or more (rapid or very rapid permeability) and
2. A water holding capacity of 0.10 inch/inch of soil or less (low or very low water holding capacity)--in all horizons to a depth of 80 inches or to bedrock if bedrock is within 80 inches of the surface.

The choice indicates that if a component has soil properties, according to state labeling, favorable for the application of the pesticide Triumph 4E Insecticide (trademark), the entry is Yes. If the component does not have favorable properties the entry is No.

Column Physical Name: indraingrp
Column Label: IN Drainage Grp

A group of soils that share similar recommendations for drainage whether the drainage is subsurface or surface. (Agronomy Guide, ID-160 - Purdue University)

Column Physical Name: innitrateleachi
Column Label: IN NO3 Leach Index

A number which reflects annual precipitation, rainfall distribution, and hydrologic group. The system allows comparison of the amount of nitrate which could be leached in percolating water. The numbers were obtained from the Midwest National Technical Center and are used in Indiana.

Column Physical Name: misoimgmtgrp
Column Label: MI Soil Mgmt Grp

A system for ranking soils for major uses, developed by Michigan State University. Soils are assigned to a group according to the dominant profile texture, the natural drainage class, and the management groups are listed in the same order as the series named in the complex. (Mokma, D.L., E.P. Whiteside, and J.F. Schneider. 1978. Soil Management Units in Land Use Planning. Mich. State Univ., Ext. Bull. E-1262, 12 pp.)

Column Physical Name: vasoimgtgrp
Column Label: VA Soil Mgmt Grp

Column Physical Name: mukey
Column Label: Mapunit Key

A non-connotative string of characters used to uniquely identify a record in the Mapunit table.

Column Physical Name: cokey
Column Label: Component Key

A non-connotative string of characters used to uniquely identify a record in the Component table.

<td>ruledesign</td>
<td>Rule Design</td>
<td>An indicator of the design scheme of the rule. The entry provides an indication of which end of the fuzzy value range, 0 or 1, represents the most limiting features. Most interpretive rules are designed such that the most limiting features are those with a fuzzy value closest to 1. However, interpretive rules that are designed to evaluate the favorable features of a soil, such as the suitability as a gravel source, may be written such that the most limiting features are those with a fuzzy value closest to 0.</td>
</tr>
<tr>
<td>ruledesc</td>
<td>Description</td>
<td>A narrative text definition of a rule.</td>
</tr>
<tr>
<td>dataafuse</td>
<td>Ready to use?</td>
<td>Indicates whether or not an object is approved for use.</td>
</tr>
<tr>
<td>mrecentrulecwlu</td>
<td>Most Recent Rule Component When Last Updated</td>
<td>The date of the most recently updated component of an interpretation. This date is not necessarily the when last updated date of the interpretation itself. An interpretation may have a subrule, evaluation or property that was updated more recently than the master interpretation (rule) itself. The time of update of an interpretation component (subrule, evaluation, property) in NASIS is not explicitly reflected in other components that may reference the updated component.</td>
</tr>
<tr>
<td>rulekey</td>
<td>Rule Key</td>
<td>The unique identifier of a record in the Rule table in NASIS.</td>
</tr>
<tr>
<td>distmdkey</td>
<td>Distribution Metadata Key</td>
<td>A non-connotative string of characters used to uniquely identify a record in the Distribution Metadata table.</td>
</tr>
<tr>

</table>
Table Column Descriptions

Table Physical Name: distlegendmd
Table Label: Distribution Legend Metadata

Column Physical Name: areatypename
Column Label: Area Type Name

The name of a particular type of area. Area type names include "state", "county", "mlra", etc.

Column Physical Name: areasymbol
Column Label: Area Symbol

A symbol that uniquely identifies a single occurrence of a particular type of area (e.g. Lancaster Co., Nebraska is NE109).

Column Physical Name: areaname
Column Label: Area Name

The name given to the specified geographic area.

Column Physical Name: ssastatus
Column Label: Survey Status

Identifies the operational activity of a soil survey area and currency of published soil information. Examples are Non-Project, Update and Published.

As of SSURGO version 2.1, values for this attribute are no longer provided. This attribute will be dropped from the next major SSURGO version.

Column Physical Name: cordate
Column Label: Correlation Date

The date the final correlation document for a soil survey is signed, expressed as month, year (e.g. 07/1999).

Column Physical Name: exportcertstatus
Column Label: Export Certification Status

The level of certification assigned to a tabular data package for a particular soil survey area.

Column Physical Name: exportcertdate
Column Label: Export Certification Date

The date and time that soil survey area tabular data was exported from NASIS.

Column Physical Name: exportmetadata
Column Label: Export Metadata

Narrative text notes (metadata) associated with the assignment of the tabular data certification status for a particular soil survey area.

Column Physical Name: lkey
Column Label: Legend Key

A non-connotative string of characters used to uniquely identify a record in the Legend table.

Column Physical Name: distmdkey
Column Label: Distribution Metadata Key

A non-connotative string of characters used to uniquely identify a record in the Distribution Metadata table.

Column Physical Name: distlegendmdkey
Column Label: Distribution Legend Metadata Key

A non-connotative string of characters used to uniquely identify a record in the Distribution Legend Metadata table.
Table Column Descriptions

Table Physical Name: distmd
Table Label: Distribution Metadata

Column Physical Name: distgendate
Column Label: Distribution Generation Date

The date and time that a request to export data, which was submitted by a NASIS user, was actually processed.

Column Physical Name: diststatus
Column Label: Distribution Status

The current status of a NASIS export request. This status may reflect either a pending request status or a processed request status.

Column Physical Name: interpmaxreasons
Column Label: Interpretation Maximum Reasons

The maximum number of reasons recorded for the corresponding soil interpretation.

Column Physical Name: distmdkey
Column Label: Distribution Metadata Key

A non-connotative string of characters used to uniquely identify a record in the Distribution Metadata table.

Table Column Descriptions

Table Physical Name: mdstatdomdet
Table Label: Domain Detail Static Metadata

**Column Physical Name: domainname**

*Column Label: Domain Name*

The name of the domain to which a column's values are restricted. A domain is a finite list of character strings that a column's value may assume.

**Column Physical Name: choicesequence**

*Column Label: Choice Sequence*

Specifies the sequence in which the members of a domain should be ordered or displayed.

**Column Physical Name: choice**

*Column Label: Choice*

A character string that represents a member of a domain. This value must be unique for every member of a given domain.

**Column Physical Name: choicedesc**

*Column Label: Choice Description*

The narrative text description or definition of a member of a domain.

**Column Physical Name: choiceobsolete**

*Column Label: Obsolete Choice?*

Indicates if a choice in a choice list or domain is considered "obsolete". If obsolete, data being currently populated would likely use a different choice.

Specifies the sequence of the columns in a database table.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>colphynme</td>
<td>Column Physical Name</td>
</tr>
</tbody>
</table>

The name that is used to physically implement a table column in a database management system. In a database table, each column's physical name must be unique.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>collogname</td>
<td>Column Logical Name</td>
</tr>
</tbody>
</table>

A name associated with a column that is more connotative than the column's corresponding physical name. For a SSURGO table, every column's logical name must be unique, making a column's logical name a suitable alias for identifying a column. For SSURGO, column logical names are lower case character strings with no embedded blanks, where individual parts of the logical name may be separated using the underscore character.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>collabel</td>
<td>Column Label</td>
</tr>
</tbody>
</table>

A descriptive label associated with a column. For a SSURGO table, every column's label must be unique, making a column's label a suitable alias for identifying a column. For SSURGO, column labels are typically mixed case character strings with embedded blanks.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>logicaldatatype</td>
<td>Logical Data Type</td>
</tr>
</tbody>
</table>

A column's logical data type is its generic, software independent data type. Since the SSURGO standard does not correspond to any specific database management system (DBMS), the SSURGO metadata records only logical data types. How a logical data type can be physically implemented varies from DBMS to DBMS.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>

**Table Label:** Table Static Metadata

<table>
<thead>
<tr>
<th>Column Physical Name</th>
<th>Column Label</th>
<th>Data Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tabphyname</code></td>
<td>Table Physical Name</td>
<td>The name that is used to physically implement a table in a database management system. In a database, each table's physical name must be unique.</td>
</tr>
<tr>
<td><code>tablogname</code></td>
<td>Table Logical Name</td>
<td>A name associated with a database table that is more connotative than the table's corresponding physical name. For SSURGO, every table's logical name must be unique, making a table's logical name a suitable alias for identifying a table. For SSURGO, table logical names are lower case character strings with no embedded blanks, where individual parts of the logical name may be separated using the underscore character.</td>
</tr>
<tr>
<td><code>tablabel</code></td>
<td>Table Label</td>
<td>A descriptive label associated with a database table. For SSURGO, every table's label must be unique, making a table's label a suitable alias for identifying a table. For SSURGO, table labels are typically mixed case character strings with embedded blanks.</td>
</tr>
<tr>
<td><code>tabdesc</code></td>
<td>Table Description</td>
<td>A narrative text description of what a database table represents or records.</td>
</tr>
<tr>
<td><code>iefilename</code></td>
<td>Import/Export File Name</td>
<td>The base part of the file name of a table's associated ASCII pipe delimited import/export file. The complete name of a table's associated import/export file is the base name followed by the characters &quot;_.txt&quot;. For example, if the base name is &quot;alpha&quot;, the name of the associated import/export file is &quot;alpha.txt&quot;.</td>

</tbody>
</table>

**Available water storage (AWS):** The volume of water that the soil, to a depth of 25 centimeters, can store that is available to plants. It is reported as the weighted average of all components in the map unit, and is expressed as centimeters of water.

AWS is calculated from AWC (available water capacity) which is commonly estimated as the difference between the water contents at 1/10 or 1/3 bar (field capacity) and 15 bars (permanent wilting point) tension, and adjusted for salinity and fragments.

**Drainage Class - Dominant Condition:**

The natural drainage condition of the soil refers to the frequency and duration of wet periods. This column displays the dominant drainage class for the map unit, based on composition percentage of each map unit component.

**Drainage Class - Wettest:**

The natural drainage condition of the soil refers to the frequency and duration of wet periods. This column displays the wettest drainage class assigned to an individual component of the map unit whose composition in the map unit is equal to or exceeds 15%.

**Hydrologic Group - Dominant Conditions:**

Hydrologic Group is a grouping of soils that have similar runoff potential under similar storm and cover conditions. This column displays the dominant hydrologic group for the map unit, based on composition percentage of each map unit component.

**Irrigated Capability Class - Dominant Condition:**

The broadest category in the land capability classification system for soils. This column displays the dominant capability class, under irrigated conditions, for the map unit based on composition percentage of all components in the map unit.

<tr>
<td>attributeuom</td>
<td>Attribute Units of Measure</td>
<td>The units of measure in which the corresponding soil attribute is recorded.</td>
</tr>
<tr>
<td>attributeuomabbrev</td>
<td>Attribute Units of Measure Abbreviation</td>
<td>The abbreviated form of the units of measure in which the corresponding soil attribute is recorded.</td>
</tr>
<tr>
<td>attributetype</td>
<td>Attribute Type</td>
<td>A string that indicates if the corresponding Soil Data Viewer rule pertains to an intrinsic soil property or a soil interpretation.</td>
</tr>
<tr>
<td>nasisrulename</td>
<td>NASIS Rule Name</td>
<td>A name that uniquely identifies a particular NASIS rule (interpretation).</td>
</tr>
</tbody>
</table>
### Table Column Descriptions

<table>
<thead>
<tr>
<th>Table Physical Name:</th>
<th>sdvattribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Label:</td>
<td>SDV Attribute</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ruledesign</td>
<td>Rule Design</td>
</tr>
</tbody>
</table>

An indicator of the design scheme of the rule.

1 = limitation  
2 = suitability  
3 = class  

When rule design is either "limitation" or "suitability", this entry provides an indication of which end of the fuzzy value range, 0 or 1, represents the most limiting features. When rule design is "class", the rating values are not considered to be logically ordered.

Most non-class interpretive rules are designed such that the most limiting features are those with a fuzzy value closest to 1. However, non-class interpretive rules that are designed to evaluate the favorable features of a soil, such as the suitability as a gravel source, may be written such that the most limiting features are those with a fuzzy value closest to 0.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>notratedphrase</td>
<td>Not Rated Phrase</td>
</tr>
</tbody>
</table>

For a soil interpretation, the phrase to be used when a rating cannot be determined. The default value for this string is "Not rated", but NASIS permits the designer of an interpretation to change this default.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>mapunitlevelattribflag</td>
<td>Map Unit Level Attribute Flag</td>
</tr>
</tbody>
</table>

Indicates if the corresponding attribute is considered to be "at the map unit level", in the map unit table hierarchy.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>complevelattribflag</td>
<td>Component Level Attribute Flag</td>
</tr>
</tbody>
</table>

Indicates if the corresponding attribute is considered to be "at the component level", in the map unit table hierarchy.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmonthlevelattribflag</td>
<td>Component Month Level Attribute Flag</td>
</tr>
</tbody>
</table>

Indicates if the corresponding attribute is considered to be "at the component month level", in the map unit table hierarchy.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>horzlevelattribflag</td>
<td>Horizon Level Attribute Flag</td>
</tr>
</tbody>
</table>

Indicates if the corresponding attribute is considered to be "at the horizon level", in the map unit table hierarchy.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>tiebreakdomainname</td>
<td>Tie Break Domain Name</td>
</tr>
</tbody>
</table>

In some cases the column that is being aggregated to the map unit level corresponds to an attribute whose values are restricted to a ranked domain. In this case, this rank value is used to resolve ties. In order to be able to retrieve this rank value, the corresponding domain name must be provided.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>tiebreakruleoptionflag</td>
<td>Tie Break Rule Option Flag</td>
</tr>
</tbody>
</table>

For intrinsic soil properties, whether ties should select the lowest or highest value may be an arbitrary decision. In such a case, this flag can be set, and in advanced mode the user can then specify at run time whether the lowest or highest value should be selected in case of a tie.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>tiebreaklowlabel</td>
<td>Tie Break Low Label</td>
</tr>
</tbody>
</table>

The term to be displayed for the option to break ties by selecting the lowest value.

<table>
<thead>
<tr>
<th>Column Physical Name:</th>
<th>Column Label:</th>
</tr>
</thead>
<tbody>
<tr>
<td>tiebreakhighlabel</td>
<td>Tie Break High Label</td>
</tr>
</tbody>
</table>

The term to be displayed for the option to break ties by selecting the highest value.

</tbody>
</table>

**Column Physical Name:** tiebreakrule  
**Column Label:** Tie Break Rule

*Indicates if ties should be broken by selecting the lowest value (-1) or the highest value (1).*

**Column Physical Name:** resultcolumnname  
**Column Label:** Result Column Name

*The name of the column in which the results of the aggregation process are ultimately stored.*

**Column Physical Name:** sqlwhereclause  
**Column Label:** SQL Where Clause

*Explicit constraints used to restrict which records in a table are subject to being aggregated. One of several possible mechanisms for specifying constraints as to which records are subject to being aggregated. Multiple constraint mechanisms may be concurrently specified.*

**Column Physical Name:** primaryconcolname  
**Column Label:** Primary Constraint Column Name

*The name of a column used to constrain which records in a table are subject to being aggregated. One of several possible mechanisms for specifying constraints as to which records are subject to being aggregated. Multiple constraint mechanisms may be concurrently specified.*

**Column Physical Name:** pcclogicaldatatype  
**Column Label:** Primary Constraint Column Logical Data Type

*The logical data type of the corresponding primary constraint column.*

**Column Physical Name:** primaryconstraintlabel  
**Column Label:** Primary Constraint Label

*A connotative label associated with a column used to constrain which records in a table are subject to being aggregated. This label is displayed in the Soil Data Viewer interface to indicate to the user what kind of constraining value is being requested.*

**Column Physical Name:** secondaryconcolname  
**Column Label:** Secondary Constraint Column Name

*The name of a column used to constrain which records in a table are subject to being aggregated. One of several possible mechanisms for specifying constraints as to which records are subject to being aggregated. Multiple constraint mechanisms may be concurrently specified.*

*The choice list for the secondary constraint column is constrained to data found in records that match the value specified for the primary constraint column.*

**Column Physical Name:** scclogicaldatatype  
**Column Label:** Secondary Constraint Column Logical Data Type

*The logical data type of the corresponding secondary constraint column.*

**Column Physical Name:** secondaryconstraintlabel  
**Column Label:** Secondary Constraint Label

*A connotative label associated with a column used to constrain which records in a table are subject to being aggregated. This label is displayed in the Soil Data Viewer interface to indicate to the user what kind of constraining value is being requested.*

**Column Physical Name:** dqmodeoptionflag  
**Column Label:** Depth Qualifier Mode Option Flag

*Indicates if the depth qualifier for the corresponding soil attribute can be changed at run time.*

**Column Physical Name:** depthqualifiermode  
**Column Label:** Depth Qualifier Mode

*Indicates the means by which layer depths are qualified: "Surface Layer", "All Layers" or "Depth Range". Pertains to properties of a soil horizon or layer.*

**Column Physical Name:** layerdepthtotop  
**Column Label:** Layer Depth to Top

*Layer depth to top, when layer depths are qualified by "Depth Range".*
## Table Column Descriptions

**Layer depth to bottom, when layer depths are qualified by "Depth Range".**

**The units of measure in which layer depth range is specified (centimeters or inches), when layer depths are qualified by "Depth Range".**

**Indicates if the month range qualifiers for the corresponding soil attribute can be changed at run time.**

**Beginning month qualifier (full month name) for soil properties at the component month level or below.**

**Ending month qualifier (full month name) for soil properties at the component month level or below.**

**The method by which horizon level attribute values are aggregated in order to derive a value to represent the corresponding component. There are only two options, weighted average and weight sum. For the vast majority of horizon level attributes, weighted average is used. Weighted sum may be appropriate for a horizon level attribute whose corresponding unit of measure is something/(linear unit of measure). At the time this was written, the only horizon level attribute for which weighted sum is used is available water capacity, whose unit of measure is cm/cm.**

**Indicates if null values for the corresponding soil attribute should be conditionally converted to zero at run time.**

**The value that should be substituted in lieu of a null value in the aggregation results for the corresponding soil attribute. This value is populated when a null result should be interpreted as something other than null. Examples include flooding and ponding frequency class, where a null value should be interpreted as "None", and depth to soil restrictive layer or depth to water table, where a null value should be interpreted as signifying that no restrictive layer or water table exists within a certain depth.**

**Indicates if the corresponding soil attribute is available in the basic mode of the Soil Data Viewer application.**

**An integer number that unique identifies a map legend. A map legend identifies some of the attributes needed to create the legend for a corresponding thematic map.**

**The desired number of classes in a thematic map legend. At the current time this value is only required when map legend type is “Natural Break Classes”.**
## Table Column Descriptions

### Table Physical Name: sdvattribute
Table Label: SDV Attribute

<table>
<thead>
<tr>
<th>Column Physical Name</th>
<th>Column Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>maplegendxml</code></td>
<td>Map Legend XML</td>
<td>Information that is ultimately used to convey how the map legend for the corresponding soil attribute should be rendered.</td>
</tr>
<tr>
<td><code>nasissiteid</code></td>
<td>NASIS Site ID</td>
<td>An integer number that uniquely identifies a NASIS site.</td>
</tr>
<tr>
<td><code>wlupdated</code></td>
<td>Last Updated</td>
<td>The last date in which any data element of a particular NASIS object (area, data mapunit, etc.) was modified.</td>
</tr>
<tr>
<td><code>algorithmname</code></td>
<td>Algorithm Name</td>
<td>The name of a method by which a soil property or interpretation may be aggregated. In some table contexts, the default aggregation method for the corresponding soil attribute.</td>
</tr>
<tr>
<td><code>componentpercentcutoff</code></td>
<td>Component Percent Cutoff</td>
<td>The component percent composition value below which components should not be included in the aggregation process.</td>
</tr>
<tr>
<td><code>readytodistribute</code></td>
<td>Ready to Distribute</td>
<td>Indicates if the corresponding soil attribute or Soil Data Viewer rule is ready to distribute publicly.</td>
</tr>
<tr>
<td><code>effectivelogicaldatatype</code></td>
<td>Effective Logical Data Type</td>
<td>The logical data type of the output rating value. For most aggregation methods, this is the same as the logical data type of the column that is the subject of the SDV Rule in question. For aggregation method &quot;Percent Present&quot;, the effective logical data type will always be &quot;Integer&quot;. For aggregation method &quot;Weighted Average&quot;, for a class soil interpretation, the effective logical data will always be &quot;Float&quot;.</td>
</tr>
