For recommended responses, see the Montana Drought Plan or should reconvene the local drought committee. Severe Drought officials to convene local drought committees. Advisory Committee strongly encourages local Drought Alert officials to convene local drought committees. Drought Impact Types - Governor’s Drought Advisory Committee strongly encourages local officials to convene local drought committees. Severe Drought - Local officials should have local drought planning efforts underway or should reconvene the local drought committee at the earliest opportunity. For recommended responses, see the Montana Drought Plan.

The National Weather Service (NWS) Weather / Precipitation Summary for May 2011 starts by stating, “Cool and wet were two words that described May’s weather in Montana.” For many Montanans, as true as this statement is, it may be an understatement by now. As of June 13, the assessment of water supply and moisture conditions by the Governor’s Drought Advisory Committee has concluded that all 56 of the state’s counties are best characterized as “Moist.” Major flooding has or is expected to have a significant impact on the river valleys of the state for weeks to come.

The NWS report goes on to note that May 2011 was the 12th coolest May on record for the state, May 2010 having averaged one degree F. cooler. Also revealing is the fact that May was the fourth consecutive month of below normal temperatures for the state as a whole.
